

Hoping for wireless advantage?...

.....or are you doing something about it?

Innovative products drive success

Having a clear cost advantage or the most compelling product can radically change the competitive dynamics in any market, including yours. This advantage is born out of innovation.

With over 250 talented developers, engineers, scientists and mathematicians, together with our significant portfolio of intellectual property, we can help you achieve

a cutting-edge advantage over your competitors.

Innovation is our key ethos at Cambridge Consultants - and by applying the experience we have amassed over 40 years, we have repeatedly helped clients become market leaders through innovation. If you're seeking that special edge then we can help you too.

We thrive on complex wireless system design

We strive to provide technical excellence for our clients and have developed many 'world firsts' - such as Cambridge Silicon Radio (CSR) - developers of the world's first, and now market-leading, single-chip CMOS Bluetooth solution, and development of the first European UWB product to obtain FCC certification under the new part 15 regulations.

Recognised as a world leader in the field of wireless technology and product development, we treat every project with the same professional rigour. We don't subscribe to the view that wireless is a 'black art' - instead we employ an ISO9001 registered design process that yields predictable and repeatable results, even on the most demanding projects.

Market focussed solutions

Our wireless experience spans a wide range of sectors, including telecommunications, automation, healthcare, automotive and defence. Project examples range from ultra-low cost consumer radio, to high value professional satellite handset equipment.

Through our different market foci, we're able to adopt the best practice across markets and technologies and bring these to bear in your development.

Wireless centre of excellence

Cambridge Consultants is a recognised centre of excellence in wireless product and technology design. With significant investment in wireless expertise, development tools and equipment for high performance wireless engineering, we offer a straightforward 'one-stop-shop' across the vast majority of wireless systems available today. Whilst able to provide 'standards-based' solutions, we also provide custom radio design that achieves the ultimate performance for a given application.

Adding value throughout the development cycle - from concept definition to support in the field, we provide flexible services from initial studies through to full turnkey product design.

As an independent design house, we're not tied to a particular technology - we'll determine the best technology to meet your technical and commercial needs.

To allow you to excel in your market, our wireless developers offer all the help you need.
